Southwest Fisheries Center Administrative Report H-88-7

AMERICAN SAMOA TUNA LANDINGS COMPUTER PROGRAMS

Jerry L. Fuqua and Ann C. Todoki
Southwest Fisheries Center Honolulu Laboratory
National Marine Fisheries Service, NOAA
Honolulu, Hawaii 96822-2396

May 1988

NOT FOR PUBLICATION

PREFACE

This report gives information on two computer programs created to summarize tuna data collected in American Samoa by the National Marine Fisheries Service, Southwest Fisheries Center Honolulu Laboratory. The first part of the report covers PSEIN, a program that summarizes data from purse seine landings and transshipment of tuna. The second part summarizes LONGLINE, a program that maps catch and effort for tuna caught by foreign longline vessels. Screen dumps and examples of output are included as figures, and program listings are included as appendixes.

The data for these report generators are confidential, but data reporting conventions are described in two internal reports by Fishery Biologist Gordon S. Yamasaki of the Honolulu Laboratory's American Samoa field station, and Biological Technician (Fisheries) Russell Y. Ito of the Honolulu Laboratory, and Victor A. Honda, currently of the Southwest Region Enforcement Office.

The programs were created by Dr. Jerry L. Fuqua (formerly with the Honolulu Laboratory and now with the Naval Ocean Systems Center in San Diego, California) and are an offshoot of his earlier work which involves mapping Hawaii. They are implemented for microcomputers with math co-processors. The documentation was completed, and the programs maintained, by Computer Programmer Ann C. Todoki of the Honolulu Laboratory. People interested in using these programs are encouraged to refer to the Fishery Management Research Program, Honolulu Laboratory, for more information.

PSEIN: AMERICAN SAMOA PURSE SEINE REPORT GENERATOR

Introduction

The report-generating program PSEIN is written in dBASE III PLUS and offers the user a number of options for summarizing cannery landing and length-frequency statistics. With each option, the user may specify whether the report should produce statistics for any of four quarterly periods or for the entire year. For the cannery landing options, input files must be of the Southwest Fisheries Center Honolulu Laboratory Standard FL008AA2 type (Samoan Cannery Purse Seine and Transshipment Landings). For the length-frequency options, input files must be of the RP043AA1 type (Purse Seine Length Frequency). These files should be in ASCII form.

The available options for cannery landing reports are total cannery landing statistics and cannery landing statistics by United Nations Food and Agriculture Organization's (FAO) area fished. With either option, the results may be viewed on the screen or printed out. When printouts are desired, the user may select one of two report forms, confidential or public. The confidential form reports total tonnage and trips, in addition to catch per trip. The public form does not contain total tonnage and number of trips. In both cases, the statistics for purse seiner and transshipment landings are reported separately.

Options available for length-frequency reports are basic length statistics (average, minimum, and maximum sampling population) for total sampling population and sampling population by area, and length-frequency histogram figures for total sampling population and sampling population by area. With each option, the user may produce a printout or view results on the screen.

Program Execution

To execute PSEIN, the user must activate dBase III PLUS, usually by typing "dbase" and then pressing the carriage return key (<CR>). At the dBase III PLUS dot prompt, type "do psein" and press <CR>. The main PSEIN menu will appear (Fig. 1), listing the six report options available to the user. Cannery landing reports are generated through options 1 and 2, while length-frequency reports are generated through options 3-6. To exit PSEIN, the user may press the "x" key. Cannery landing reports are for the three species groups: skipjack tuna, Katsuwonus pelamis; yellowfin tuna, Thunnus albacares, and bigeye tuna, T. obesus; and albacore, T. alalunga, marlin, Tetrapturus spp., and others. Length-frequency reports are for the species skipjack, yellowfin, and bigeye tunas. The procedure for using each option is outlined below. In each case, after the user has pressed the appropriate key, a two-window system is displayed. The top window is the communication window, which is used for interaction between the program and the user. Filename prompts, report options, and program status are displayed on this portion of the screen. The lower window is the data display window, which is used to preview results. The program listing is shown in Appendix A.

Cannery Landing Reports

Option 1.—Cannery Landing Report (Confidential and Public)

PSEIN will initially prompt the user for the filename of the ASCII input file containing the raw, cannery landing data. The complete filename, including extension, should be entered along with the DOS path. An example of a file containing cannery landing data is FL008Y80.SDF. If the file cannot be found, a message to that effect is displayed, and the user is prompted to reenter the appropriate filename. Once the file is found, PSEIN will set up some temporary work files. This process is monitored through messages displayed in the communication window.

After the work files have been allocated and initiated, a report option menu (Fig. 2) will be displayed. The user may select any of four quarterly report options, the annual report option, or exit back to the main menu. As soon as a selection has been made, computations are initiated and continue as long as the "WORKING. . ." message appears on the screen. Upon completion of computations, the program asks whether output should be printed or displayed on the screen. If the print option is selected, the user is asked whether the confidential (full) report or the public (partial) report should be printed. Sample printouts (for the first quarter of 1980) of both reports are in Figure 3 (confidential) and Figure 4 (public). (Confidential data have been replaced by hypothetical numbers.) If the screen display option is selected, the first section of the confidential report appears in the data display window. The second section may be viewed by pressing any key. A subsequent key entry returns the user to the option menu. (Sample screen output is shown in Figure 5.)

Option 2.—Cannery Landing Report by Area (Confidential and Public)

This option follows the same procedure as option 1. Results are for purse seiners, categorized by FAO areas fished: 71A, 71B, 71, 77A, 77B, and 77. With the screen option in effect, the results for each area may be viewed sequentially. Sample printouts of the confidential and public reports for the first quarter of 1980 are in Figures 6 and 7, respectively. The corresponding screen displays are shown in Figure 8.

Length-Frequency Reports

In each of the four length-frequency options (options 3-6), the user is requested to give the filename of the ASCII input file, complete with extension and DOS path. The file must be of the RP043AA1 type, containing length measurements. As an example, a small demonstration file of this type named "MINI.SDF" will be used here. Once preliminary work files are set up, each option requests, through the option menu, a time period for which the length-frequency statistics are to be computed.

Option 3.—Length-Frequency Report

Active statistical computation is signaled by the "WORKING. . .(n)," where n is a descending integer. Statistical computations are complete

after it reaches 1. The resulting statistics specify the sample population, average length, standard deviation, and minimum and maximum lengths for skipjack, yellowfin, and bigeye tunas. The results may be printed out or viewed on the screen in the data display window, in a manner similar to that in options 1 and 2. Sample results from the MINI.SDF file for the first quarter of 1985 are in Figures 9 and 10.

Option 4.—Length-Frequency Report by Area

With this option, computations are the same as in option 3 but are categorized by FAO area. Six sets of length-frequency statistics are produced, one for each FAO area. Figure 11 shows the printout for the first quarter of 1985 for MINI.SDF, and Figure 12 shows the corresponding screen dumps.

Option 5.—Length-Frequency Histogram

This option produces histogram statistics for skipjack, yellowfin, and bigeye tunas. The number of fish found in partitioned intervals of 50 mm is reported for each species. The histogram range is 0-1,200 mm for skipjack tuna, 0-2,000 mm for yellowfin tuna, and 0-2,100 mm for bigeye tuna. Also reported is the total number of fish found outside the histogram ranges.

Computation is indicated by the "WORKING. . ." and "COUNTDOWN: (n)" messages. Here, n starts from the total number of records in the file and decreases to 1. A sample of a first quarter printout is in Figure 13, with the corresponding screen dumps shown in Figure 14.

Option 6.—Length-Frequency Histogram by Area

This option reports the same histogram statistics as option 5 but is broken down into six FAO areas. This option cycles through area computation; that is, area 71A statistics are computed and printed or viewed, then areas 71B, 71, 77A, 77B, and 77 follow sequentially. The user is prompted at each step for desired output (printout or screen dump), thereby allowing the printer to be free during computation. For each cycle, a message is displayed to indicate which area statistics are being computed. The "WORKING . . ." and "COUNTDOWN: (n)" messages are also displayed. Figure 15A-F displays the area printouts for the first quarter of 1985 for MINI.SDF. Figure 16 shows the corresponding screen dumps for area 71A. (The screen dumps for 71B, 71, 77A, 77B, and 77 would have a similar form.)

Note that the options 5 and 6 are I/O intensive and in dBase III PLUS, somewhat CPU intensive. Because the RP043AA1 files can be quite large, histogram reports may take a substantial amount of computer time. It is recommended that the files be transferred to a hard disk or Bernoulli[1] cartridge before processing is done.

LONGLINE: AMERICAN SAMOA LONGLINE CATCH AND EFFORT REPORT GENERATOR

Introduction

LONGLINE is a report-generating program used to produce files containing catch per unit effort (CPUE) information for various species of commercially caught fish. The program produces a single output array file containing a complete summary of CPUE information for 5° cells in the domain lat. 55°S-50°N, long. 100°W-130°E for 10 species. This file can be referenced at a later time for statistical information. In addition, 10 species-specific files are produced, summarizing the CPUE statistics for each species. Each of these files has the required format to be utilized with the Hawaiian Island Mapping Program (HIMP) (Fuqua 1987[2]) to produce graphic displays of CPUE for a given species and time period.

Program Execution

LONGLINE is an executable program, filename LONGLINE.EXE, compiled by using M.S. FORTRAN v.4.0. From the DOS prompt, the user can activate the program by entering "LONGLINE" and then pressing <CR>. After the program title appears, the user is prompted to supply an input filename, including extension, drive designation, and DOS path. The input file must be of the Honolulu Laboratory Standard FC003AA1 file type. The file FC003Y62.DAT will be used as an example of such a file. If the file is not found, the program will ask the user to reenter the filename. Once the file is found, the user is prompted for an output filename that has no more than eight characters and no extension. LONGLINE will produce 11 output files with this filename, but with 11 different extensions. It is recommended that the input name also be used as the output name. In our example, this would be FC003Y62 (see Fig. 17).

After the filenames have been specified, an option menu will appear (Fig. 18). Any of four quarterly reports or an annual report may be selected. An option is selected by entering the corresponding number and <CR>. LONGLINE responds by specifying the initial (mq1) and final (mq2) months. For example, if the first quarter is selected, mq1 = 1 and mq2 = 3. (The annual report would result in mq1 = 1 and mq2 = 12. The summer quarter would give mq1 = 7 and mq2 = 9.) LONGLINE will read in and process the input file data, then issue an "END OF FILE" message. Computation will continue, and output files will be produced until the "Stop--program terminated" message is issued. Control is then returned to DOS.

---

[2]Fuqua, J. L. 1987. Hawaiian Islands mapping program (HIMP). Southwest Fish. Cent. Honolulu Laboratory, Natl. Mar. Fish. Serv., NOAA, Honolulu, HI 96822-2396. Southwest Fish. Cent. Admin. Rep. H-87-20, 138 p.

Output File Protocol

The output array (ASCII) file will be designated with a nAY extension. Here, n = 1, 2, 3, 4, or A, corresponding to a first, second, third, or fourth quarter or to an annual report option. In our example, the output array for the spring quarter would be FC003Y62.3AY. The output array will contain a header giving the name of the original input file and the report period. The first section of data will be the total number of hooks set in each 5° cell. Cells start from the northwest and run east and south to the last cell in the southeast. The total area is 26 cells lateral and 21 vertical. A vertical index (j = 1, 21) is listed at the beginning of each record. Following the first section will be 10 consecutive species-specific groupings of data. Each group will consist of a catch data section and a CPUE data section. Preceding each group will be an introduction record giving the species name and the CPUE weighting factor (WT). For the first group, species equals "Albacore" and WT equals 100.0. Thus, a value of 3.05 in the CPUE section represents 3.05 albacore caught per 100 hooks, for all sets during the given period.

The species-specific (ASCII) output files will be designated with a nSP extension. Here, n = 1, 2, 3, 4, or A, following the same protocol for output array files. The two-letter code designating the species is SP. The species code designation is in Table 1.

Table 1.--The species code designations for extensions of the species-specific (ASCII) output filenames.

Species code	Species
al	Albacore
yf	Yellowfin tuna
be	Bigeye tuna
bf	Bluefin tuna
sj	Skipjack tuna
bm	Blue marlin
sm	Striped marlin
bb	Black marlin
sf	Sailfish
wa	Wahoo

These files will contain records listing the location of the center of a 5° cell and the corresponding weighted CPUE data. With each file, these records will be preceded by two records specifying the latitude (-55, 50 which equals 55°S-50°N) and absolute longitude (100, 230 which equals long. 100°W-130°E) ranges (see footnote 2). Latitudes and longitudes are given in degrees and fractions of degrees. These data are suitable for plotting onto a Pacific basin image by HIMP. An appropriate basin image is contained in the file PACIFIC.MAP, with the corresponding ASCII and binary digitized data in the files PACIFIC.DAT and PACIFIC.BIN, respectively. A typical CPUE map is in Figure 19.

Program Listing

The source code LONGLINE.FOR is included in Appendix B. If modifications are to be made, compilation with the M.S. FORTRAN 4.0 compiler must be made with the 4N+ option active. This allows for eight-character, variable names to be fully supported. The production of an executable file from the modified source file LONGLINE1.FOR would be initiated by the following command line:

```
FL /4N+ LONGLINE1.FOR .

*CANNA*
*
*****************************************************************
*MODULE TO PRODUCE CONFIDENTIAL AND/OR PUBLIC REPORTS OF CANNERY
*LANDINGS FOR PURSE SEINE AND TRANSSHIPMENT VESSELS, BY AREA
*(AREAS COVERED ARE FAO: 71, 71A, 71B, 77, 77A, AND 77B). REPORT
*OPTIONS ARE FOR ANY OF FOUR QUARTERS OR FOR AN ENTIRE YEAR
*(ANNUAL). DBF FILES USED TO PRODUCE REPORTS ARE AS FOLLOWS:
*
*  FL.DBF       DB VERSION OF ENTIRE INPUT FILE
*  FLST.DBF     FL STRUCTURE FILE, WITH THE FOLLOWING FIELDS:
*
*                  DSN          DATA SET NAME (FL008AA2)  8
*                  CC           CANNERY CODE               1
*                  VN           VESSEL NAME               20
*                  YY           YEAR                       2
*                  MM           MONTH                      2
*                  DD           DAY                        2
*                  FAO          CAPTURE AREA CODE          3
*                  CA           CAPTURE AREA NAME         20
*                  VT           VESSEL TYPE                2
*                  NA           NATION                     2
*                  SJ           SKIPJACK (LBS.)            8
*                  YF           YELLOWFIN (LBS.)           8
*                  BE           BIGEYE (LBS.)              8
*                  AC           ALBACORE (LBS.)            8
*                  ML           MARLIN (LBS.)              8
*                  MX           MIXED (LBS.)               8
*                  BLANK        BLANK FIELD                6
*                  BATCH        BATCH NUMBER               6
*                  SEQNUM       SEQUENCE NUMBER            8
*
*  CPST.DBF     FL SUBFILE CONTAINING ONLY FIELDS USED FOR THE
*               FINAL REPORTS
*  CPSTST.DBF   CPST STRUCTURE FILE
*                  (YY,MM,DD,FAO,VT,NA,SJ,YF,BE,AC,ML,MX)
*  CPST1.DBF    CPST SUBFILE USED TO PRODUCE FINAL REPORTS.
*               WILL CONTAIN ONE OF FOUR QUARTERS OR ELSE
*               ENTIRE YEAR OF CPST DATA.
*  VESSELS.DBF  TEMPORARY SORT FILE FOR DETERMINING NUMBER OF
*               SEINERS FOR THE REPORT PERIOD
*  VESSELT.DBF  TEMPORARY SORT FILE FOR DETERMINING NUMBER OF
*               TRANSHIPMENT VESSELS FOR REPORT PERIOD

*MODULE TO PRODUCE LENGTH-FREQUENCY HISTOGRAM REPORTS BY CATCH AREA
*(FAO AREAS ARE 71, 71A, 71B, 77, 77A, 77B).  EACH REPORT
*WILL STATE THE NUMBER OF FISH SAMPLED (N), AND LIST THE NUMBER OF
*FISH FALLING INTO INCREMENTAL 50MM HISTOGRAM BINS, MINIMUM FOR
*SKIPJACK, YELLOWFIN, AND BIGEYE. ALL LENGTHS ARE GIVEN IN
*MILLIMETERS. OPTIONS ARE FOR ANY OF FOUR QUARTERS OR FOR AN ENTIRE
*YEAR (ANNUAL). DBF FILES USED TO PRODUCE REPORTS ARE AS FOLLOWS:
*
*  RP.DBF      DB VERSION OF ENTIRE INPUT FILE
*  RPST.DBF    RP STRUCTURE FILE, WITH THE FOLLOWING FIELDS:
*
*                 DSN          DATA SET NAME (RP043AA1)  8
*                 VN           VESSEL NAME              20
*                 VT           VESSEL TYPE               2
*                 NA           NATIONALITY               2
*                 SS           SAMPLING SITE            15
*                              SAMPLING DATE:
*                 SYY            YEAR                    2
